

Assignment-1

Q1. Create a new S3 bucket in your AWS account with a unique name that includes your initials and the current date (e.g., mybucket-AB-20240618). Set the region to Asia Pacific (Mumbai).

Ans:

I created a new S3 bucket with a unique name containing my initials and the current date. I selected **Asia Pacific (Mumbai)** as the AWS Region and created the bucket with the default security settings.

Q2. Upload three different files (an image, a PDF, and a text file) to your new S3 bucket using the AWS Management Console. Make sure each file has a meaningful name related to your favorite app (e.g., instagram-logo.png, spotify-playlist.pdf, zomato-menu.txt).

Ans:

I uploaded three different files to the S3 bucket using the AWS Management Console: an image file, a PDF file, and a text file. The files were given meaningful names related to popular apps and were successfully uploaded to the bucket.

Q3. Set the access permissions on one of your uploaded files so it is publicly accessible via a URL. Test the link in your browser to confirm it works
Hint: Use the 'Make public' option in the AWS S3 console and copy the object URL.

Ans:

I disabled the Block Public Access setting to allow public access to the selected S3 object.

Figure 1: Block Public Access Disabled

I added a bucket policy to allow public read access to the instagram-logo.png file

Figure 2: Bucket Policy Added

I copied the S3 Object URL and opened it in the browser. The image was displayed successfully, confirming that the file was publicly accessible.

Q4. Enable versioning on your S3 bucket, then upload a new version of one of your files (e.g., upload an updated zomato-menu.txt with different content). Check the version history to confirm both versions are stored
Hint: Use the 'Versions' tab in the bucket to view all versions.

Ans:

Step 1:

I opened my S3 bucket and enabled **Versioning** from the **Properties** section.

Step 2:

I uploaded the updated zomato-menu.txt file with different content.

Step 3:

I enabled **Show versions** in the Objects section and verified that multiple versions of zomato-menu.txt were stored.

Q5. Write a short comparison (3-4 sentences) explaining the main differences between AWS S3, EBS, and Glacier. Mention which one you would use for storing Instagram profile pictures, Flipkart order history, and old IRCTC booking records, and why.

Ans:

Amazon **S3** is an object storage service used to store files such as images, documents, and other data, while **EBS provides** block storage mainly for EC2 instances and works like a virtual hard disk. **S3** would be suitable for **Instagram profile pictures** because images can be stored and accessed easily, while **EBS** can be used **for Flipkart order history** when the data is stored and processed by an application running on an EC2 instance. Amazon **Glacier** (S3 Glacier) is suitable for **old IRCTC booking records** because it is designed for long-term archival storage where the data is rarely accessed and lower storage cost is important.
